MCFO Hybrid Chemical Tag & IHC for Adult CNS

- All tissues and solutions are at room temperature (RT), unless noted. Always protect tissue from light exposure.
- For details on dissection and fixation see FlyLight Protocol – Adult Dissection and 2% Fixation.
- For mounting and embedding instructions refer to FlyLight Protocol – DPX Mounting.
- For videos of dissection of adult brains see Adult Brain Dissection or for adult CNS see Adult CNS dissection.
- For videos of mounting for DPX embedding of adult CNS see Adult Mounting or for larval CNS see Larval Mounting.
- For video demonstrations of DPX embedding see the movie DPX Embedding.

1. **Prepare chemical tag stock.** Dilute Cy2 SNAP-tag ligand in anhydrous DMSO to a concentration of 200 µM to create a 100x stock solution. Store in aliquots at -20°C. The stock is stable for several months.

2. **Dissect.** Dissect adult brains or CNS in cold Schneider’s Insect Medium (S2).

3. **Fix.** Transfer tissue to 2 mL Protein LoBind tubes filled with 2% paraformaldehyde (PFA) in S2 at RT. Fix for 55 minutes at RT while nutating.

4. **Post-fix wash.** Remove the fix and add 1.75 mL phosphate buffered saline with 0.5% Triton X-100 (PBT) and wash for 10-15 minutes while nutating. Perform up to 3 additional washes if waiting to add chemical tag. Samples may be held in PBT for up to 7 hours prior to chemical tagging.

5. **Chemical tag labeling.** Remove PBT and add 200 µL 2 µM Cy2 SNAP-tag ligand in PBT per tube. Incubate for 15 minutes at RT on a rotator with tubes upright.
   - Cy2 SNAP-tag ligand (10 µL/mL for final concentration of 2 µM)

6. **Post-chemical tag washes.** Remove the chemical tag and do a brief rinse with 1.75 mL 0.5% PBT. Allow the tissue to settle to the bottom and then remove the rinse solution and add 1.75 mL 0.5% PBT. Wash for a total of 2 X 10-minute washes while nutating. Samples can be held for at least 3 days prior to beginning IHC steps below.

7. **Block Goat Serum (GS) & Normal Mouse Serum (NMS).** Remove PBT and add 200 µL 5% GS, 5% NMS in PBT per tube. Incubate for 1.5 hours at RT on a rotator with tubes upright.

8. **Primary antibodies.** Remove block and add primary antibodies diluted in 5% GS, 5% NMS in PBT for a volume of 200 µL per tube. Incubate for 4 hours at RT on a rotator with tubes upright. Then continue incubation at 4°C on a rotator with tubes upright for 2 overnights.
   - Rat α-FLAG Tag (1:200 or 5 µL/mL)
   - Rabbit α-HA Tag (1:300 or 3.3 µL/mL)

9. **Post-primary washes.** Remove the primary antibody and do a brief rinse with 1.75 mL 0.5% PBT. Allow the tissue to settle to the bottom and then remove the rinse solution and add 1.75 mL 0.5% PBT. Wash for a total of 3 X 30-minute washes while nutating.

10. **Secondary & direct label antibodies.** Remove PBT and add the secondary antibodies diluted in 5% GS, 5% NMS in PBT for a volume of 200 µL per tube. Incubate for 4 hours at RT on a rotator with tubes upright. Then continue incubation at 4°C on a rotator with tubes upright for 3-4 overnights.
   - ATTO647N Goat α-Rat (1:300 or 3.3 µL/mL)
11. **Post-secondary washes.** Remove the secondary antibody and do a brief rinse with 1.75 mL 0.5% PBT. Allow the tissue to settle to the bottom and then remove the rinse solution and add 1.75 mL 0.5% PBT. Wash for a total of 3 X 30-minute washes while nutating. If needed, store tissue in 0.5% PBT at 4°C while nutating or lay tube flat and rotate.

12. **Pre-embedding fixation.** Remove PBT and add 1.75 mL 4% PFA in PBS at RT. Fix for 4 hours at RT while nutating.

13. **Post-4% PFA washes.** Remove the 4% PFA and do a brief rinse with 1.75 mL 0.5% PBT. Allow the tissue to settle to the bottom and then remove the rinse solution and add 1.75 mL 0.5% PBT. Wash for a total of 4 X 15-minute washes while nutating. If needed, store tissue in 0.5% PBT at 4°C while nutating or lay tube flat and rotate.

14. **Mount.** Mount the tissue on a poly-L-lysine (PLL) coated cover glass.
   - For making PLL see FlyLight Recipe – Poly-L-Lysine.

15. **Dehydrate.** Move the cover glass through a series of 7 cover glass staining jars filled with increasing concentrations of ethanol (30%, 50%, 75%, 95%, 100%, 100%, 100%). Soak the cover glass for 10 minutes in each jar.

16. **Xylene clearing.** (IN THE HOOD). Move the cover glass through a series of 3 jars filled with xylene. Soak the cover glass for 5 minutes in each jar.

17. **DPX embedding.** Add 7 drops of dibutyl phthalate in xylene (DPX) on top of the tissue mounted on the cover glass. Place the cover glass (DPX down) on a prepared slide with spacers. Use the edge of a glass slide to gently press down on the center of the cover glass to seat the cover glass onto the slide. Let the slide dry in the hood for 2 days before viewing.
Reporter Genotype
